

DOCTOR BENJAMIN RUSH,

PROFESSOR OF CHEMISTRY, IN THE UNIVERSI-TY OF PENNSYLVANIA.

SIR,

A S the following thefis contains phyfical obfervations made on fimilar principles of natural philofophy, I therefore have juftly confidered no one more proper for me to dedicate it to, than one whofe diffinguished abilities are fo celebrated, and univerfally known, that my refearches upon the fubject, should confequently become the more interefting and fatisfactory to the reader; but if you should conceive there was juft room for difference of opinion, I should be glad to receive it, and annex it to this finall pamphlet.

To be eminent in furgery, how natural is it to conclude, that a man muft be capable of performing with eafe and addrefs, the various important operations which fall within the line of his province; at the fame time we will conceive him fufficiently well verfed in all the fyftematic branches of anatomy, &c. By the fame rule, we will not allow a man is a phyfician, becaufe he attends the fick, and prefcribes remedies for them, unlefs he is capable of flating his cafes, and making a report of his method of cure, fo as to give full fatisfaction to any learned and approved faculty of phyficians : but indeed it is to be regretted there is more room for pretenders to the latter, than to the former fcience.

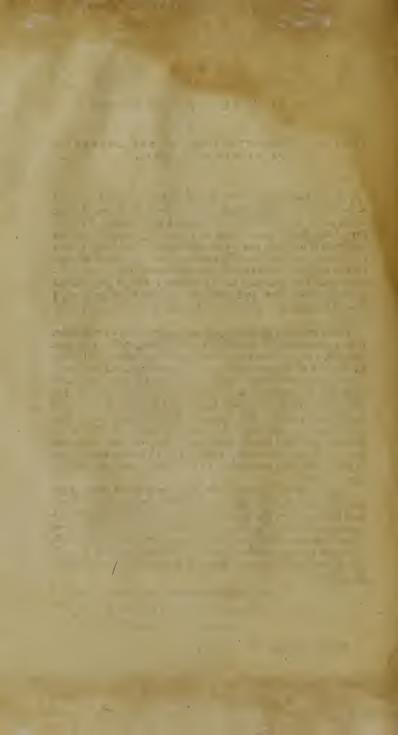

The venerable Hippocrates has complained, that in his days many hid their ignorance under ornaments of drefs, and frove to get the good liking of the people by their appearance at public games. But in those more enlightened ages, it is not a little to be admired, why the legislature do not take every possible means to prevent any fuch impositions in the healing art, which is so interesting to mankind in general.

With profound refpect and efteem, I am,

Your most obedient humble fervant,

MICHAEL BOURKE.

Norfolk, Virginia, Feb. 10th, 1792.

REVIEW, &c.

HAVING lately observed various fugitive pieces on the hydrophobia, of little account, it particularly drew my attention to a theme which appears to me to have been but very little understood by most of those who have attempted to treat upon it.

With aftonifiament I have obferved them propose to condemn the practice of the ancients, without giving any fufficient physical reasons, why their practice should be altogether or in part abolished : for, the want of fuccess, in one or more cases, is not sufficient to reject it ; unless the particular state of different patients, differently treated, could be exactly afcertained and stated ; or otherwise an error mult be proved upon undeniable and known principles of natural philosophy. However, in the course of these enquiries upon the fubject, I shall endeavour to show how far they were right, and how far wrong in this respect, and at the fame time, we will also take the practice of the moderns into confideration, with a view to establish and make any amendment it would feem to admit of.

There are many methods of cure on record, in this diforder, faid to be equally fuccefsful, but most of them are ra her chimerical and not to be depended upon; therefore, it would tend rather to confuse than be of any real advantage, to infert them. The morbid animal poifon, which produces this dreadful diforder, caufing no apparent change in the fate of the folids and fluids, as the other poifons of this clafs do, except on the part to which it was firft applied; from this, one would naturally conclude, the evil was conveyed into the confliction by means of the nervous fluid; and I am perfuaded, it was reflexions of this nature, that firft led Boerhaave and Mead to think fo; I confefs I was flrongly attached to this opinion too; but from the refult of more ferions reflexion upon that head, I fhall endeavour to prove that the brain every where throughout the body, and the cellular membrane, are the proper feat of it; for this is not the only diforder of the brain and its productions, which does not appear to effect any change in the fubftance of it any where.

It is allowed by all, that the brain is the only fenfible part of the body, and that it is diffufed over every moving fibre, in form of a fenfible mucus (which Kirkland calls it, in his differtation upon that organ) which fibres are connected by means of the cellular membrane.

The canine virus coming in contact with the human body, either in a dry or humid ftate, whether with or without a wound, the ftimulus it occasions is first felt and attracted by the brain, and is received fooner or later, by fympathy of affection, into the habit.

Dr. James, in his treatife on this fubject, fuppofes the cellular membrane is the receptacle of this as well as fome other infections: indeed it cannot admit of any doubt, that those parts are the feat of it, from the exquisite degree of fensibility always manifest in the poor patient; the organs of his fenses become fo irritable and easily affected, that the flightest breath of air, found to the ear, and light to the eye become painful and difagreeable.

This irritating caufe, by affecting the vafcular fyftem in general, caufes a particular ftricture on the veffels, which, by increasing the action and reaction of the folids and fluids one upon another, is always productive of those inflammatory fymptoms which are conftantly attendant on this diforder; which ftricture on the blood-veffels, which are every where defined to feed the brain and nerves with animal fpirit, thus, by preventing the regular influx of this great agent of life and motion into the interflices of the muscles and other moving fibres of the body, fpafms and convultions are produced. This animal æther, though derived from matter (from the effence of our food, and from the circumambient air we breathe) is fo wonderfully fpiritualized. that we know neither the nature nor confiftence of it, as, being indifcernible, and incapable of being received by any artificial means; but still, we know in a great measure the uses of it to the animal aconomy. I may justly fay, it is this fubtile spirit, which receives the touch of electric fire, and passes it through the body as quick as thought, which also feems to be the caufe of immediate and remote fympathy ; and from the following observations, I shall endeavour to prove, that it is with it the all wife and mighty artift has united that intelligent fpirit which he was pleafed to infuse into the human body, fo that a diforder being first produced, in that which I call the animal fpirit, from the evil effect of the canine virus received into the habit, the faculties of the rational foul become fo depraved, that towards the close of this melancholy cataftrophe, the wretched victim really thinks, at the approach of every violent paroxyim, he is changed into a dog, which we may clearly underftand from his barking and fnapping at his beft friends, and foaming at the mouth as those animals do in this diforder; and as he finds this dreadful change coming upon him at intervals. he warns his friends of it, and tells them to keep out of his way.

Let us reflect for a moment, that the eternal wisdom in all ages and at all times, doth prefide over the actions of men ; and when we do or will to act contrary to the light of understanding given us to avoid evil and do good, he feems immediately to take notice of it, and informs the body of the injustice done, either against him, or ourselves, or others, by ftriking us with terror, and with a felf-conviction of our own guilt; which more or lefs diforders the whole frame, and throws every moving fibre into a fate of tremor and spasin, which not unfrequently destroys the rational faculties; and brings on leffer degrees of madnefs: though still, I am perfuaded that fuch diforders frequently have many other remote and proximate causes, but still, as they are most commonly spiritual, they almost always baffle the use of medicine, which is God's fecond cause of health. Thus the moral conduct has a good or evil tendency towards the health of mind and body, which are evident proofs of the existence of a just and all wife God.

After a nice examen and diffection of a perfon who died of the hydrophobia, which mr. Fauvrey had performed, he gives us the following conjectural account.

"The nature of the poilon is fuch, that it diffolves the balfamic and nutricious parts of the blood, whence the veins are dried up, fo as not eafily to admit any blood from the " arteries, and the arterial blood by this means fuftaining " the action and imprefion of its veffels fo long a time, is " ftill further diffolved, attenuated and fpiritualized, and " thus fent in too great quantity and with too great rapidity " to the brain, whence those convultions and distractions," &c.

Although the dread of water is a fymptom particularly afcribed to this fpecies of madnefs, ftill we find it is neither peculiar to it, nor always attendant on it, for it has been obferved that this remarkable fymptom is proper to fome fevers and fome particular inflammations, &c.

The finallest particle of the faliva of a mad dog is fufficient to produce the infection, and if it should take effect, it will first produce pain, inflammation, and ulceration on the part, before the terrible fymptoms appear, though the wound, if any there be, should entirely heal and difappear; the neighbouring parts first begin to be affected with pains fimilar to those in the rheumatism, till by degrees the poifon is received into the vifcera and vital parts. From the fift there will be always observable a constant constriction in the gullet, together with a difficulty of fwallowing. But if the patient is affected at the fight of liquid, a horror feizes him, and if he strives to drink, spass are produced, with anxiety and loss of fense; there is constantly a particular stricture and heavinefs on the breaft, and a ftruggling, as it were, for breath observed : a fighing, a nausea, and a vomiting, which tightness and seeming weight upon the breast, increase towards the clofe of this melancholy fcene: an nnufual flow of faliva then comes on; an involuntary emiflion of femen and priapifm alfo: the fever and thirft increase; the urine becomes lixivious and in fmall quantities; the tongue hangs out, and the mouth foams; the pulle becomes throbbing and convulfive ; the ftrength fails ; cold fweats come on, and the miferable patient foon expires in the fpafus.

Although at prefent we are doubtful whether the canine poifon is the effect of morbid action of the parts endowed with life; or whether it proceeds from a more remote caufe, yet it is most probable, as dogs in general are apt to feed upon putrid cadaverous fubfrances with great avidity, the gas which is feparated from fuch in a pntrid or other evil flate of fermentation in their flomachs may be capable of producing fuch evil effects; it is alfovery probable, the gastric juice with which those animals are fupplied, which enables them to diffolve and digeff digeft bones fwallowed wholly and entire, contributes not a little to the more fpeedy extrication and production of this kind of mephitic air, in greater quantities, in a given time, than could poffibly be effected by a flower operation of the like procefs in other animals, who are not peffeffed of fuch a quick digefting menftruum.

Let us obferve, that under fimilar circumftances, as to a faulty digeftion in the human body, approaching to an acid or other evil ftate of fermentation in the ftomach and primæ viæ, it is always productive of nervous diforders and fpafins, more or lefs, and of low fpirits: confequently the more immediate, or proximate caufe of those difeases, admits of a very ftriking analogy. Therefore, it is highly probable, if we were to live lefs upon animal, and more upon vegetable diet, diforders of this nature would be lefs prevalent.

Dr. James has obferved, that this kind of madnefs, properly belongs to the canine genus, confifting of three fpecies, viz. dogs, foxes, and wolves, to whom only it feems inherent and natural, fearcely ever appearing in other animals, except it be inflicted by those of the dog kind.

Some are of opinion, the canine poifon is of an acid, and fome again fuppofe it to be of an alkaline nature; but from my ideas of the nature and first caufe of it, I am thrictly in favour of the former opinion; admitting the existence of ærial acid, derived from putrid animal fubfrances, which repels flame and extinguishes fire: in whatever fhape, and in whatever flomach it is generated, it always acts more or lefs upon the living principle.

Dr. Seleg, who has written upon this fubject, thinks the pervagum and intercoftal nerves, are the feat of this complaint, becaufe most of the fymptoms happen where these nerves are interspersed; from whence it appears that the ftomach is the principal and original seat.

By way of a caution to the reader, it may not be amils to infert the pathogmonic figns of madnefs in dogs, according to Boerhaave, as follows. "He neither cats nor drinks; he looks fad and fullen, and runs at any thing in his way, whether man or beaft, known, or unknown; with a murmuring noife, but without barking, nodding as if he was overpowered with fleep, and endeavouring to hide himfelf." Others alfo obferve, that a dog not infected, upon finelling the infected one, will fhun him, and run away with horror; and that those creatures will become difordered if they go into kennels where mad dogs have been kept: but it was never known that mankind received the infection any other way, than by coming in contact with the poifon.

It is very remarkable, that this animal virus fometimes hes dormant for many months; but in general it appears in three or four weeks: and if in fix weeks no figns of the diforder appear, a perfon is ufually concluded to be fafe. However we have had inflances of its appearing in two or three days after the bite: yet there are alfo inflances, well attefted, in which, one or two years have elapfed before it had taken place, which, though it fhould feem curious and myfterious in this diforder, I think it is no lefs obfervable in the finall pox, meafles, venereal difeafe, and in fhort, in all other kinds of malignant infection, or contagious miafmata floating in the atmosphere. Thefe phenomena, I fhall take npon me to explain as follows, although I have never known either ancient or modern writers to fay any thing fatisfactory upon that head.

If we turn our thoughts on chemistry, we may fee how many various operations of it tend to prove that there is a power in bodies, properly called repulsion, which prevents them from uniting together, after they have approached each other to a certain point, which is as real and as abfolute as the power of attraction. Though still from changes incident to matter, it is, under fuch circumstances, still fubject to the laws of attraction. That those respective powers are as proper to the living fubject, as to other material bodies. cannot be denied from the following observations, and I believe the one to be equally various with the other. How evident does the power of repulsion appear in local gangrenes, where we fee the chemical properties of the found and living parts form a feparating action from those of the morbid and unfound : the found and elastic fibre, by the force of cohefion, preferving its natural form and fhape: and the rarefying effect of fire in the circumambient air, the bulk of the fluid parts being inceffantly enlarged; the fire acting by pulfation, as well as diftenfion, it conftantly excites the elaftic fibre to action, and fo maintains motion and vital heat. In spacelous or gaugrenous cases, one part of the living subject preferves life and motion, whilft a diffolution and deftruction enfues in another, by lofing its fixed air, after a fpecies of fermentation is commenced, although the air is a common medium by which the union of parts is preferved. still, if it was received into the found parts, it would promote a like diffolution and destruction there. But those found and living parts are still preferved from its destructive quality, by their retaining due degrees of denfity and cohefion in their own component parts.

Let us further observe, that the tender and delicate confitution of the folids, not opprefied with gross humours, is exquisitely fensible, if unattended with any diforder in the brain or nerves, which acuteness of fensibility is various in different habits and climates, as the former are more or less full; and as it approaches to greater or less degrees, the fympathy of affection and fymptoms appear fooner or later.

The tenfe and lax fibre we know are by nature predifpofed to favour the proximate caufe of difeafe, the former by exciting too much heat, and the latter too little in the animal economy; but when it is fo happily difpofed as to be neither too tenfe nor lax, the offices of fecretion and excretion are in fuch flate well and duly performed; becaufe the heat of the body confequently falls between extremes which conflitute that falutary flate in which we are lefs fufceptible of the remote caufe of difeafe.

Cullen diffingnishes two species of this diforder. The hydrophobia rabiofa, when there is a defire of biting, and the hydrophobia simplex, when there is not any such defire.

Celfus, Galen, Mead, and Etmuller, all recommend in this, as well as in other venomous cafes, to enlarge the wound made by the bite, by a circular incifion and fearification, to apply a cautery to it, and keep it open for at leaft forty days: but as this method appears rather too harfh, I fhall beg leave to advife a far preferable one, which is by the moderns now confidered as a fpecific; they fearify the part, and fprinkle cantharides every fecond or third day into the wound, and keep it open for a confiderable time.

But if the poifon is first received on a bony or tendinous part, I would by all means recommend the practice of the people of Connecticut—for, it is confidently faid, they never have experienced any ill effects in fuch cafes, from their ufual treatment. They rub a handful of falt and water well on the part, and lay a parcel of falt thereon, and wrap it up in different folds of a wet cloth, dipt in the fame falt water.

Under this head I shall also mention the following instance of a cure, which is really worth notice, which was taken from the records of the British royal academy of fciences. A maid of twenty years of age, having all the symptoms, was bathed in a tub of river water, wherein a bushel of falt had been diffolved; they plunged her in naked, again and again, till harraffed almost to death , they then left her fitting in it quite fenselefs: when she came to herfelf, she was furprifed to find herfelf looking at the water without any concern.

I am of opinion that this practice may be used with great advantage in far advanced and defperate cafes; provided the perion was of a lax and loofe habit of body (as to the conditution of the folids) but if it should happen to be the reverse, I think the patient might be prepared for the falt bath by blood letting. From the nature and penetrability of fea falt, it does not appear to me, that there is any method that promises such a speedy relief as this; it is calculated not only to counteract the evil tendency of the poison, but also to supply the defect of vital heat, and support the exhausting strength, without breaking the crafts of the fluids, as mercury does.

And what is ftill more perfuafive, the frequent and fudden plunging of the patient over head and ears in fea water, after the bite, has been generally reckoned to be the beft and fureft prefervative in this difeafe. In those advanced ftages when the poilon feems to be received into the vital parts, there is no probability of fuceeding with mercury, though it is most commonly received into practice, in the cure of this malady.

Alexipharmic drinks, with testaceous powders, were fo much extolled among the ancient physicians, that Galen affirmed nobody had ever died, who used this remedy : these abforbent earths were to be taken every day for forty days fucceffively, either alone or with Gentian root and Frankincense in wine.

The ancients having moft commonly practifed blood letting, in fuch cafes, perhaps their method of cure, principally on this account, was the beft; which I am perfuaded, they had advifed, rather to keep the patient low, and his ftrength under; than that they ever fuppofed a plethora or redundance of humours had any fhare in them.

It is certain, that where a fricture lies upon the veffels from an irritating caufe, as I have before fufficiently flared, the bulk of the humour muft be leffened by venefection, to bring on a relaxation, and fo give a free and eafy influx to frefn animal fpirit into the interflices of the mufcles, and facilitate the progrefs of the cure by the help of proper remedics.

This is not the only cafe in which we are not to depend upon the pulle with refpect to blood letting. In fome pletheric cafes, the vefiels are fo overcharged and diffended beyond their natural degree of contraction, and their tonic powers fo impeded, that the pulfation is fearcely to be felt, without any appearances of an acute or inflaminatory diforder: but we muft have other convincing proofs of plethora, before this ferious and delicate operation flould be performed.

I am more particular on this point, becaufe there are fo many various opinions for and against the necessfity of bloodletting in the hydrophobia.

From the affertions of the ancients, and their rational method of cure, I am perfuaded that the acrimony peculiar to this difeafe, may be deftroyed more ways than one.

To those who are but little fkilled in physics, it may appear, that there are various ways and means by which we may relieve one and the like complaint, proceeding from a defect of the vital heat; fill, fuch ways and means must not differ effentially in nature, to accomplish the great defign of affifting and supporting the living principle. This comparison holds good with respect to the former observation.

It must be the like cafe in this diforder, as in others; when it is far advanced, there are but very faint hopes of fuccefs; however, although the fymptoms of fubfultus tendinum are present, we must still fee what art can do; let blood first, and repeat the operation, till the patient faints : the next day try the falt bath, and after two or three days' repetition, apply the ftrong mercurial ointment by friction, fo as to raife a very gentle ptyalifm, give opium and antimonials or other perfpiratives, to relieve spafmodic stricture; and keep the patient principally upon a milk and vegetable diet, with ripe and acetous fruits, and allow a moderate use of generous wines: and when occasion shall require to loofen the belly, or free it from any acrid matter it may be troubled with, it is best to be done by injection or fome very mild and gentle aperient. The fore, or part whereon the poifon was first received, may be treated as before directed.

A frequent use of the warm bath is inadmiffible; because it debilitates the habit, and renders it unfit for taking proper means. Although it gives a temporary relief in spassion dic stricture, the evil confequences it is afterwards att ened with, by far exceed any good it may do otherwise.

THEEND.
